Introduction

The SOLA database has been created as part of a project undertaken by the UN Food and Agriculture Organization (with funding from the Government of Finland) to develop open source software that supports cadastre and registration functions in land administration agencies. It has a particular goal of making computerized systems supporting open land administration more affordable and sustainable in developing countries.

The SOLA database is implemented in a Postgre SQL database and is a relational database implementation of an extended version of the Land Administration Data Model (LADM) which is currently a Draft International Standard (DIS 19152). It has been necessary to extend DIS 19152 because of the operational needs of land administration agencies to incorporate case management and other features into any system that supports the processing of client service requests (for land information, registration and cadastre change requests and others) and the maintaining and updating of the record of rights and restrictions, ownership and property boundaries. The FLOSS SOLA software supports this range of land administration business processes and the SOLA database is an integral part of the FLOSS SOLA database.

The SOLA Data Dictionary is organized according to the database schemas defined in the SOLA database. Within each section for a schema there is a definition of all tables including their description, column, constraints and relationship details.

The SOLA database should be considered a work in progress over the period 2011 - 2013 while the initial FLOSS SOLA software is under development and pilot implementation are being undertaken. For this reason those referring to this document should check www.flossola.org to ensure they have the latest version.

Table: ba_unit

Refer to LADM DefinitionLADM Reference Object LA_BAUnitLADM DefinitionBasic administrative units (abbreviated as baunits), are needed, among other things, to register 'basic property units', which consist of several spatial units, belonging to a party, under the same right (a right must be 'homogeneous' over the whole baunit)..

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	False		LADM Definition - The identifier of the basic administrative unit
type_code	varchar(20)	False	'basicProperty'	LADM Definition - The type of the basic administrative unit
cadastre_object_id	varchar(40)	True		Cadastre object id. Introduced in Lesotho project.
name	varchar(255)	True		LADM Definition - The name of the basic administrative unit
name_firstpart	varchar(20)	False		LADM Definition - It is the part of the identifier of the property. Together with the name_lastpart is supposed to uniquely identify the property. This constraint it is not enforced, because there will be cases when it is not unique. Combination of name_firstpart and name_lastpart must derive the value of ba_unit.
name_lastpart	varchar(50)	False		LADM Definition - It is the last part of the identifier of the property. Together with the name_firstpart is supposed to uniquely identify the property. This constraint it is not enforced, because there will be cases when it is not unique. Combination of name_firstpart and name_lastpart must derive the value of ba_unit.
creation_date	timestamp	True		LADM Extension The date the ba_unit is formally recognised. In the case of titles, the date of issue
expiration_date	timestamp	True		LADM Extension The date on which a ba_unit ceases to have validity
status_code	varchar(20)	False	'pending'	The status of the ba unit.
transaction_id	varchar(40)	True		Transaction which creates the baunit.

Table: notation

All notations related with a baunit are maintained here. Every notation gets a reference number and it is always associated with a transaction.

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	False		Meaningless id.
ba_unit_id	varchar(40)	True		If the notation is only related to baunit the baunit id is given.
rrr_id	varchar(40)	True		
transaction_id	varchar(40)	False		The transaction id which brought the notation.
reference_nr	varchar(15)	False		A reference number for the notation
notation_text	varchar(1000)	True		The notation text. This text is defined by a template which is to be found in request_type. The link is established by the fact that a notation comes from a transaction which optionally can be initiated by a service which is of a certain request_type.

Table: rrr

Refer to LADM DefinitionLADM Reference Object LA_RRRLADM DefinitionA right, restriction or responsibility.

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	False		LADM Definition - Identifier for the right, responsibility and restrictions
ba_unit_id	varchar(40)	False		LADM Definition - basic administrative unit identifier
nr	varchar(20)	False		This is a unique number of rrr within a baunit to identify it in baunit.
type_code	varchar(20)	False		LADM Definition - code for type of right, responsibility restriction
status_code	varchar(20)	False	'pending'	The status of the rrr.
is_primary	bool	False	false	It marks the rrr as being primary. Only one rrr can be primary for one BaUnit.
transaction_id	varchar(40)	False		The transaction that brought changes to the rrr.
registration_date	timestamp	True		This is the registration date of the rrr. It takes the value from the approval date.
registration_number	varchar(40)	True		Registration number of the right, assigned by the office. Introduced in Lesotho project.
lease_number	varchar(20)	True		Introduced in Lesotho project. Contains lease number.
land_use_code	varchar(20)	True		Introduced in Lesotho project. Land use code for the lease.
start_date	date	True		Introduced in Lesotho project. Determines right start date (e.g. lease start date)
expiration_date	timestamp	True		LADM Definition - the dates defining when the rrr remains in force LADM Reference Object - rrr.timespec
execution_date	date	True		Introduced in Lesotho project. Lease execution date.
share	double precision	True		Actually, SOLA is defining shares in a separate table. So within one rrr we can have multiple shares instead of multiple rrr of the same type within a baunit as LADM proposes. LADM Definition - share of a right, (restriction or responsibility) expressed as a fraction with numerator and denominator
amount	numeric(29, 2)	True		LADM Definition The amount of money of the mortgage SOLA Extension: The amount of money associated with the rrr (includes amount of mortgage and ground rent amount for a lease)
land_usable	numeric(19, 2)	True		Introduced in Lesotho project. Indicates usable percentage of land for the lease ground rent calculation. Can be from 1 to 100.
personal_levy	numeric(19, 2)	True		Introduced in Lesotho project. Indicates personal levy for the lease. Can be from 1 to 2 or 0 for exempted.

due_date	date	True		SOLA Extension: The date on which a payment associated with a rrr is due (eg lease rent due date)
mortgage_interest_rate	numeric(5, 2)	True		LADM Definition Interest rate of the mortgage (percentage)
mortgage_ranking	integer	True		LADM Definition The ranking order if more than one mortgage applies to a right
mortgage_type_code	varchar(20)	True		
stamp_duty	numeric(29, 2)	True	0	SOLA Extension: The stamp duty for a lease
transfer_duty	numeric(29, 2)	True	0	SOLA Extension: The transfer duty for a lease (payable for a transfer service)
registration_fee	numeric(29, 0)	True	0	SOLA Extension: The amount of money paid for registration of a new lease or a transfer
service_fee	numeric(29, 2)	True	0	SOLA Extension: The amount of money for obtaining a given service
ground_rent	numeric(29, 2)	True		Introduced in Lesotho project. Lease ground rent fee.
cadastre_object_id	varchar(40)	True		Cadastre object ID
status_change_date	timestamp	False	now()	The date when RRR status was changed. Introduced in Lesotho project.

Documents or recognised facts providing the basis for the recording of a registration, cadastre change, right, responsibility or administrative action performed by the land office
 LADM Reference Object LA_Source
 LADM Definition Not defined

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	False		LADM Definition - Source identifier
maintype	varchar(20)	True		LADM Definition - The type of the representation of the content of the source.
la_nr	varchar(20)	False		SOLA Extension - This number is given by the land administration office for their own administration.
reference_nr	varchar(20)	True		SOLA Extension -This is the number as given by the external agency.
archive_id	varchar(40)	True		SOLA Extension - The archive identifier of the source
acceptance	date	True		LADM Definition -The date of force of law of the source by an authority
recordation	date	True		LADM Definition - The date of formalization by the source agency.
submission	date	True	now()	LADM Definition - The date of submission of the source by a party
expiration_date	date	True		
ext_archive_id	varchar(40)	True		LADM Definition -The identifier of a source in an external registration. This attribute is used to link the source with the document management system.
availability_status_code	varchar(20)	False	'available'	LADM Definition - the code describing how available this source (document) is
type_code	varchar(20)	False		LADM Definition - Type of the document (administrative_source)
content	varchar(4000)	True		LADM Definition -Content of the source (administrative_source)
status_code	varchar(20)	True		The status of the document. For some documents is important to know if the document is valid or not.
transaction_id	varchar(40)	True		The transaction that brought the document in the system. This is not valid for all documents but for some of them. There are request types that bring only documents in the system without involving a ba unit. In this case is important to know which transaction brought this document in order to handle it within transaction (approve, reject) life cycle.
owner_name	varchar(255)	True		Document owner name.
version	varchar(10)	True		Document version.
description	varchar(255)	True		Document description.
signing_date	date	True

Table: br_validation

In this table are defined the sets of rules that has to be executed. If for a rule there is not target moment specified, then the rule will not be part of the set.

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	False	uuid_generate_v4()	This is a meaningless identifier for the rule.
br_id	varchar(100)	False		Name of the business rule
target_code	varchar(20)	False		The type of the target of the the validation.
target_application_moment	varchar(20)	True		The moment of execution of the rule if the target is the application.
target_service_moment	varchar(20)	True		The moment of execution of the rule if the target is the service.
target_reg_moment	varchar(20)	True		The moment of execution of the rule if the target is the ba_unit, rrr or cadastre_object.
target_request_type_code	varchar(20)	True		If the target is a request type then here is given which is the request type. If this is null the business rule will be relevant for all services.
target_rrr_type_code	varchar(20)	True		If the target is a registration on RRR then here is given the rrr type. If this is null the business rule validation will be valid for all rrr-s.
severity_code	varchar(20)	False		Severity of the failure of the business rule.
order_of_execution	integer	False	0	The order of the execution of the rule.

Table: config_map_layer

Sola extension: In this table are defined map layers for configuring the map component. The layers can be of different types. For the type of layers supported, check out the data in the table config_map_layer_type.

Columns

Name	Type	Optional	Default	Description
name	varchar(50)	False		SOLA Extension - name of map layer
title	varchar(100)	False		The title of the layer. The title is the one that will be visible to the users. It can be localizable.
type_code	varchar(20)	False		The map layer type
active	bool	False	true	Flag to indicate whether instance of config map layer is active (or not)
visible_in_start	bool	False	true	If it is true, the layer will be switched on in the start of the map control.
item_order	integer	False	0	Map layer order of display. Smaller this number, the lower in the list of layers the layer is found.
style	varchar(4000)	True		Map layer style given in SLD. The style can be used by layers of type shape, po_jo.
url	varchar(500)	True		Url is the end point of a server based map layer. It is used by layer of type wms.
wms_layers	varchar(500)	True		The layer names separated with comma that will be requested for a wms layer.
wms_version	varchar(10)	True		The version of the wms server. Allowed values are 1.0.0, 1.1.0, 1.1.1., 1.3.0.
wms_format	varchar(15)	True		Format of the output for the wms layer. Allowed values are as defined by the wms server capabilities. Example: image/png or image/jpeg.
pojo_structure	varchar(500)	True		Plain old java object structure. It is given in the format as required by featurtype definition in geotools. It is used in layer type : po_jo. Example: theGeom:Polygon,label:""
pojo_query_name	varchar(100)	True		The name of the query that will be used to retrieve the features for this layer. It is used from layer of type po_jo.
pojo_query_name_for_select	varchar(100)	True		Query name of the query that is used to select objects corresponding to the layer. It can be used from any layer type.
shape_location	varchar(500)	True		The location of the shapefile. It is used for layers of type shape. The client application must have access to this file.
security_user	varchar(30)	True		The username to access the layer. At the moment it is not used.
security_password	varchar(30)	True		The password to access the layer. At the moment it is not used.
added_from_bulk_operation	bool	False	false	If true, the layer is added during a bulk operation.

use_in_public_display	bool	False	false	If true, the layer will be set visible when printing the public display map. It is not relevant for other kinds of map operations.

Table: map_search_option

This table contains information about the options to search objects in the map. The list of options here will be used to configure the list of search by options in the Map Search Component.

Columns

Name	Type	Optional	Default	Description
code	varchar(20)	False		The unique code of the search option. This code is used programatically.
title	varchar(50)	False		The unique title that is visible to the user. It can be localizable.
query_name	varchar(100)	False		The query that will be used for retrieving the search results. The query requires only one parameter: search_string. So, it means that queries that are used here, should contain only one parameter with this name. These queries also should return only 3 fields: - id: Unique id of returned match - label: What will be displayed to the user - the_geom: the WKB form of the geometry
active	bool	False	true	If the search option is active or not
min_search_str_len	smallint	False	3	The minimum number of characters required for the search string.
zoom_in_buffer	numeric(20, 2)	False	50	The buffer distance to use when zooming the map to display the selected object. The units of this value are dependent on the coordinate system of the map (usually meters).

application

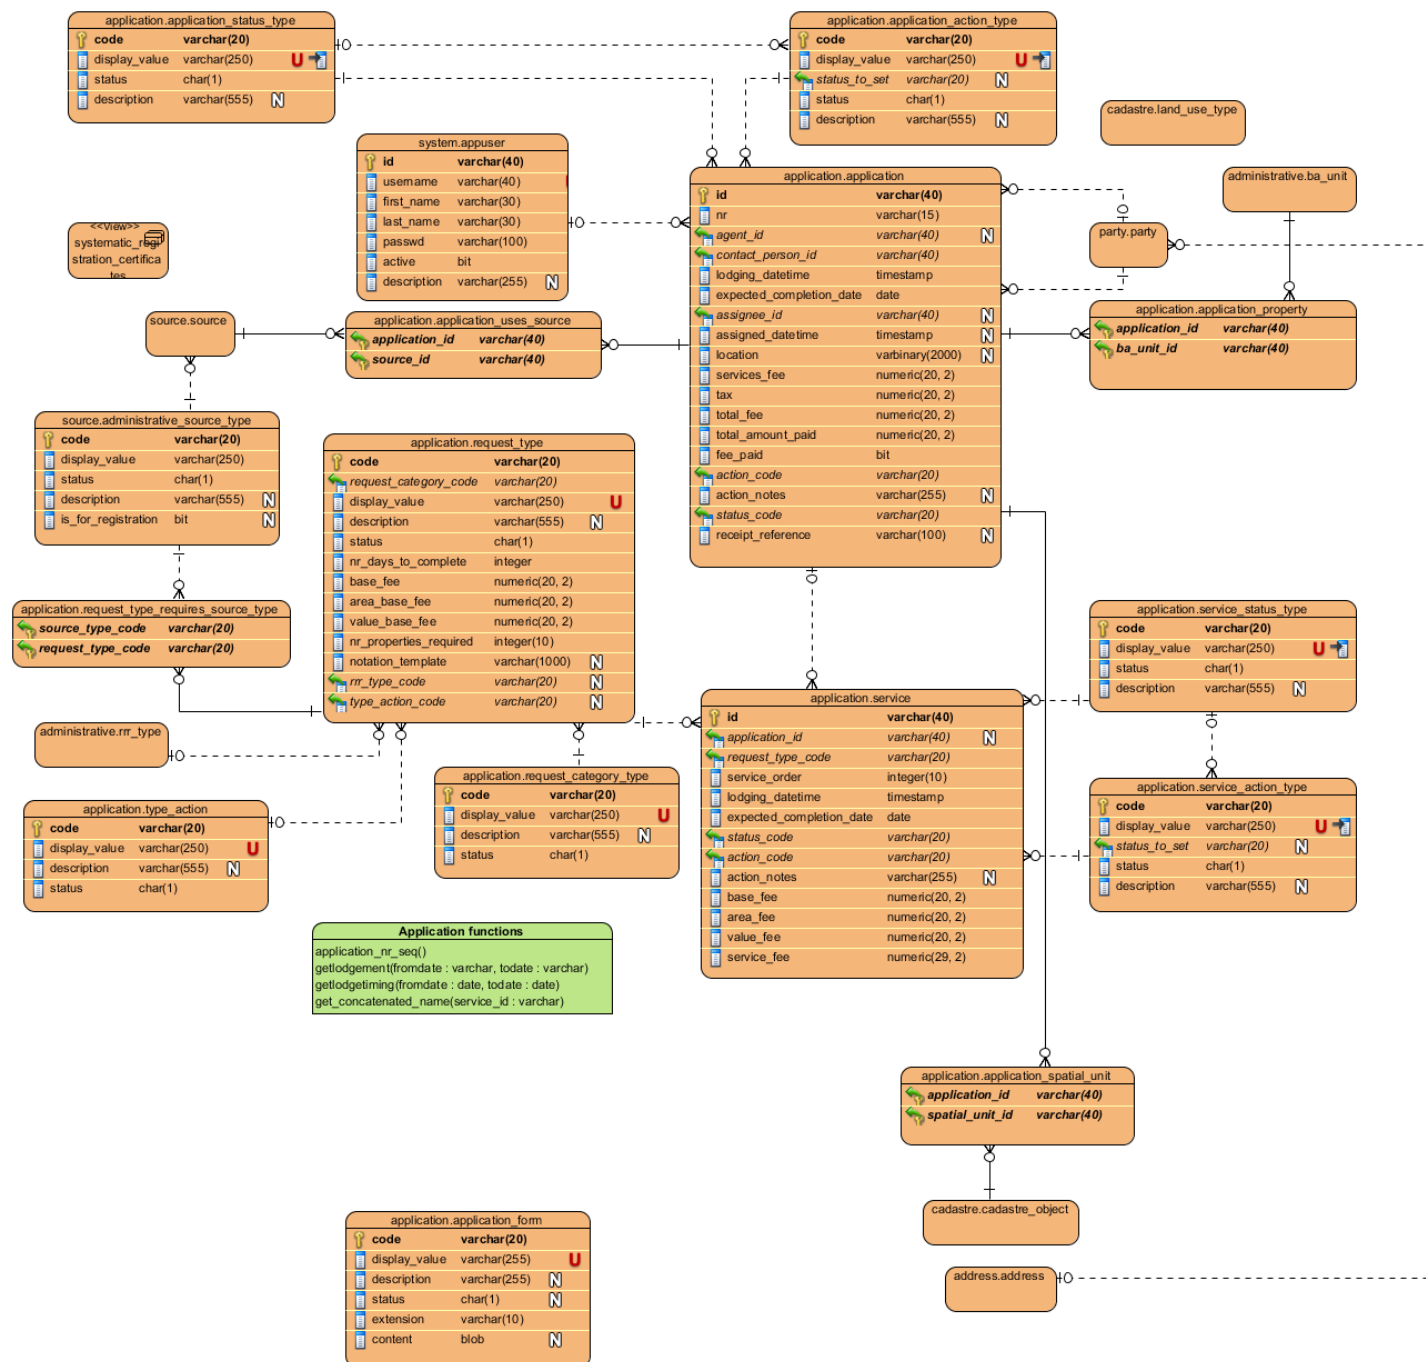

Table: application

An application is a bundle of services that a client or customer wants from the registration office.LADM Reference ObjectFLOSS SOLA ExtensionLADM DefinitionNot Applicable

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	False		SOLA Extension - application identifier

nr	varchar(15)	False		SOLA Extension - This is the application number that is exposed to the user. It is generated as the date + the ordinal number within that day.
agent_id	varchar(40)	True		SOLA Extension - The id of the agent which is filling the application. It is not necessary one of the parties involved in user rights. It can be a firm or individual.
contact_person_id	varchar(40)	False		SOLA Extension - This is the contact person and it is always an individual that can be reachable in different ways.
lodging_datetime	timestamp	False	now()	SOLA Extension - The lodging date and time of the application. This date is important because it marks the time when the application has been officially accepted from the RO.
expected_completion_date	date	False	now()	SOLA Extension - The date when the application is supposed to be completed or cancelled by then. It is a derived value by picking up the most later expected date from the services that are boundled with the application.
assignee_id	varchar(40)	True		SOLA Extension - The person that is assigned to the application. If this value is missing it means that the application is not assigned.
assigned_datetime	timestamp	True		SOLA Extension - Date and time the application is assigned. It has a meaning only if the assignee_login_name is present.
location	GEOMETRY	True		SOLA Extension - The location of the application given as multi point in the map.
services_fee	numeric(20, 2)	False	0	SOLA Extension - The total amount of services fee. This is derived as the sum of fees of all services bundled in the application.
tax	numeric(20, 2)	False	0	SOLA Extension - Tax or proportionate component of the services_fee.
total_fee	numeric(20, 2)	False	0	SOLA Extension - The total amount of the fee (including tax) that has to be paid. Derived as: services_fee + tax
total_amount_paid	numeric(20, 2)	False	0	SOLA Extension - The amount paid. Normally it must be equal to the total_fee.
fee_paid	bool	False	false	SOLA Extension - It shows if the fee is paid.
action_code	varchar(20)	False	'lodge'	SOLA Extension - The last action that happened to the application. Some values of this attribute are generated by the system.
action_notes	varchar(255)	True		SOLA Extension - Extra description about the action.
status_code	varchar(20)	False	'lodged'	The status of the application.
receipt_reference	varchar(100)	True		SOLA Extension - This is the fee receipt reference number that is exposed to the user.

View: place_name

View for retrieving place names to be used in the gis component.

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	True		Identifier of village
label	varchar(255)	True		Labels and description of village
geom	GEOMETRY	True		Description of the geometry type

View: road

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	True		Road identifier
label	varchar(255)	True		Name of each of road
geom	GEOMETRY	True		Geometry type

View: survey_control

This is a view which is used to retrieve the survey points from the spatial units. It is used from the gis component.

Columns

Name	Type	Optional	Default	Description
id	varchar(40)	True		identifier
label	varchar(255)	True		Label of island

Function: cadastre_object_name_is_valid***Parameters***

Name	Type	Direction	Description
name_firstpart	varchar		
name_lastpart	varchar		

Function: add_topo_points

This function searches for any point in source that falls into target. If a point is found then the point it is added in the target. It returns the modified target.

Parameters

Name	Type	Direction	Description
source	geometry		The source geometry
target	geometry		The target geometry

Function: snap_geometry_to_geometry

It snaps one geometry to the other. If points needs to be added they will be added.

Parameters

Name	Type	Direction	Description
geom_to_snap	geometry	inout	Geometry that has to be snapped. It can be point, linestring or polygon
target_geom	geometry	inout	Geometry that will be the target to used for snapping.
snap_distance	float		The snap distance in map units
change_target_if_needed	bool		It gives if it is allowed to change target during snapping
snapped	bool	out	An output value showing if the geometry is snapped. If it is a linestring or polygon, even if one point of them is snapped it returns true.
target_is_changed	bool	out	It shows if the target changed during the snapping process.

Table: transaction

Changes in the system come by transactions. A transaction is initiated (optionally) by a service. By introducing the concept of transaction it can be traced how the changes in the administrative schema came. Also by approving the transaction we can approve changes or by rejecting a transaction we can remove the pending changes that came with it and restore the previous state of the administrative schema.

Name	Information	Description
spatial_unit_temporary_transaction_id_fk14	From columns: transaction_id To Entity: transaction From cardinality: 0..* To Cardinality: 1	
spatial_unit_temporary_cadastre_object_type_code_fk145	From columns: cadastre_object_type_code To Entity: cadastre_object_type From cardinality: 0..* To Cardinality: 0..1	

Function: move_spatial_units

This function moves the temporary spatial units to the destination tables. This function is called after the bulk operation transaction is created from the bulk operation application.

Parameters

Name	Type	Direction	Description
transaction_id_v	varchar		
change_user_v	varchar		The user that is connected to the system and that is doing the changes.

Function: move_cadastre_objects

This function will move the cadastre objects from the bulk operation schema to the cadastre schema.

Parameters

Name	Type	Direction	Description
transaction_id_v	varchar		
change_user_v	varchar		The user that is connected to the system and that is doing the changes.

Function: move_other_objects

This function is used to move other kinds of spatial objects except the cadastre objects.
The function will add a new level if need together with a new structure type if it is not found.

Parameters

Name	Type	Direction	Description
transaction_id_v	varchar		
change_user_v	varchar		The user connected to the system doing the transaction.

Function: clean_after_rollback

This function is executed to run clean up tasks after the transaction of bulk operation is rolledback.

Function: f_for_trg_track_changes

This function is called from triggers in every table that has the columns to track changes.

If the change_user is null then it is filled with the value from the database user prefixed by 'db:'. It also checks if the record has been already updated from another client application by checking the rowversion.

Function: f_for_trg_track_history

This function is called after a change is happening in a table to push the former values to the historic keeping table.

Function: fn_triggerall

This function can be used to disable all triggers in the database. **How to use** to call to disable all triggers in all schemas in db select fn_triggerall(false); to call to enable all triggers in all schemas in db select fn_triggerall(true);

Parameters

Name	Type	Direction	Description
doenable	bool		If true all triggers will be enabled.If false triggers will be disabled.

Function: `clean_db`

This function will delete any table and function in a schema that does not belong to the standard postgis template.

Parameters

Name	Type	Direction	Description
schema_name	varchar		The name of schema that will be cleaned.

Function: `compare_strings`

Special string compare function.

Parameters

Name	Type	Direction	Description
string1	varchar		
string2	varchar		

Function: `get_geometry_with_srid`

This function assigns a srid found in the settings to the geometry passed as parameter.

Parameters

Name	Type	Direction	Description
geom	geometry		

Function: **get_translation**

This function is used to translate the values that are supposed to be multilingual like the reference data values (display_value)

Parameters

Name	Type	Direction	Description
mixed_value	varchar		
language_code	varchar		

Function: clean_db_foreign_constraints

This function can be used to drop all foreign key constraints from the database.

Function: clean_db_triggers

This function removes all triggers and their related functions in the database. It assumes that the trigger functions are found in the public schema.
